

Grapple for Forklift

Forklift Grapple - Grapples work together with the crowning operation of the bucket cylinder located on the excavator. They can mount directly onto the jib or whichever quick hitch which is in bucket position. Grapples are usually meant for the processing and handling of construction materials, timber, domestic and aggregate waste items. The grapple's boxed design has added support bridging. This particular manufactured design provides the grapple with utmost support and strength by stopping the body from breaking and twisting through its operation.

The grapple as well as all of its moving parts are constructed of hardened steel. The rotating points are designed in order to ensure holding ability and supreme closing force. The one operating it has the capacity to handle different sizes and varieties of supplies due to the jaws built-in at the end of the grapple with toes. This enables the jaws to be able to close through one another in a finger configuration for maximum handling capacity.
